

This listing of claims will replace all prior versions, and listings, of claims in the application.

**Listing of Claims:**

1. (currently amended) A tool management method executed by a tool server apparatus coupled with a remote client system via a first network and coupled with a plurality of tools via a second network, comprising the steps of:

receiving a first request from the remote client system via the first network, the first request containing a uniform resource locator path including a function field and an object field;

determining a function to be performed on the tool identified in said object field in said uniform resource locator path based on said function field in said uniform resource locator path at least in part on a first predetermined field contained in said first request; and

in response to said first request, sending a first message to the tool identified in the object field in the uniform resource locator path ~~one of said plurality of tools~~ via the second network ~~in response to said first request, wherein~~ said first message is operable for controlling an action of the tool identified in the object field in the uniform resource locator path. ~~said one of said plurality of tools;~~

~~wherein the remote client system comprises a user interface to said one of said plurality of tools.~~

2. (canceled)

3. (canceled).

4. (previously presented) The method of claim 1 further comprising the steps of:  
receiving a second message from said one of said plurality of tools associated with said action; and  
coaching said second message.

5. (previously presented) The method of claim 4 further comprising the steps of:

receiving a second request from the remote client system via the first network;  
retrieving said second message; and  
generating a response to said second request using said second message.

6. (previously presented) The method of claim 5 further comprising the step of:  
sending said response to the remote client system.
7. (canceled)
8. (previously presented) The method of claim 1 further comprising the steps of:  
receiving a connection request from the remote client system; and  
opening a connection to the remote client system, said connection being operable for  
communicating requests and responses to said requests.
9. (previously presented) The method of claim 1 further comprising the steps of:  
receiving a second request from the remote client system via the first network, said  
second request selected from the group consisting of information requests, expand requests and  
edit requests, wherein,  
in response to aid information requests, an HTML page is generated using a set of  
selected data for a tool object corresponding to a managed tool for sending to the remote client  
system,  
in response to said edit request, an HTML page is generated having a portion operable for  
user entry of one or more values for modifying a tool object attribute for sending to the remote  
client system, and  
in response to said expand requests and HTML page is generated using a set of child  
object names and relations to a parent object identified in said expand request for sending to the  
remote client system.
10. (currently amended) The method of claim 1 wherein said function field comprises first  
~~type of said first request denotes~~ an execute request.

11. (previously presented) The method of claim 1 wherein said step of sending said first message is in response to execution of a tool object method identified in said first request.

12. (original) The method of claim 11 further comprising the step of overriding said tool object method.

13. (original) The method of claim 12 wherein said step of overriding said tool object method comprises the steps of:

parsing a script source;

determining if said script source includes a method signature matching a method signature of said tool object method; and

if so, executing a corresponding portion of said script source.

14. (currently amended) The method of claim 1 wherein said first request is received ~~transferred~~ in accordance with the hypertext transfer protocol (~~HTTP~~), ~~and said portion corresponds to a uniform resource locator (URL).~~

15. (currently amended) A data processing system comprising:

circuitry on a tool server, coupled with a remote client system via a first network and coupled with a plurality of tools via a second network, configured to receive a first request from the remote client system via the first network, the first request containing a uniform resource locator path including a function field and an object field;

said circuitry configured to determine a function to be performed on the tool identified in said object field in said uniform resource locator path ~~a first type of said first request based at least in part on said function field a first predetermined field~~ contained in said uniform resource locator path ~~first request~~; and

said circuitry configured to send a first message to said tool identified in said object field in said uniform resource locator path ~~one of said plurality of tools~~ via the second network in response to said first request ~~and said first type~~, wherein said first message is operable for controlling an action of said tool identified in said object field in said uniform resource locator path, ~~one of said plurality of tools~~;

~~wherein the remote client system comprises a user interface to said one of said plurality of tools.~~

16. (canceled)

17. (canceled)

18. (currently amended) The data processing system of claim 15 further comprising:  
circuitry configured to receive a second message from said tool identified in said object field of said uniform resource locator path ~~one of said plurality of tools associated with said first action;~~ and  
circuitry configured to cache said second message.

19. (previously presented) The data processing system of claim 18 further comprising:  
circuitry operable for receiving a second request from the remote client system via the first network;  
circuitry operable for retrieving said second message; and  
circuitry operable for generating a response to said second request using said second message.

20. (previously presented) The data processing system of claim 19 further comprising:  
circuitry operable for sending said response to the remote client system.

21. (currently amended) The data processing system of claim 15 further comprising:  
circuitry operable for receiving a connection request from the remote client system; and  
circuitry operable for opening a connection to the remote client system, said connection being operable for communicating requests and responses to said remote client system ~~requests.~~

22. (previously presented) The data processing system of claim 15 further comprising:

circuitry operable for receiving a second request from the remote client system via the first network, said second request selected from the group consisting of information requests, expand requests and edit requests, wherein,

in response to said information requests, an HTML page is generated using a set of selected data for a tool object corresponding to a managed tool for sending to the remote client system,

in response to said edit requests, an HTML page is generated having a portion operable for user entry of one or more values for modifying a tool object attribute for sending to the remote client system, and

in response to said expand requests an HTML page is generated using a set of child object names and relations to a parent object identified in said expand request for sending the remote client system.

23. (currently amended) The data system of claim 15 wherein said object field in first type of said first request comprises ~~denotes~~ an execute request.

24. (original) The data processing system of claim 15 wherein said step of sending said first message is in response to execution of a tool object method identified in said first request.

25. (original) The data processing system of claim 24 further comprising circuitry operable for overriding said tool object method.

26. (original) The data processing system of claim 25 wherein said circuitry operable for overriding said tool object method comprises:

circuitry operable for parsing a script source;

circuitry operable for determining if said script source includes a method signature matching a method signature of said tool object method; and

circuitry operable for executing a corresponding portion of said script source, if so.

27-38. (canceled)

39. (previously presented) The method of claim 1 further comprising the steps of:  
receiving a second request from the remote client system via the first network; and  
generating an HTML page using a set of selected data for a tool object corresponding to a managed tool for sending to the remote client system in response to said second request.
40. (previously presented) The method of claim 39 wherein said HTML page has a portion for user entry of one or more values for modifying a tool object attribute.
41. (previously presented) The data processing system of claim 15 further comprising:  
circuitry operable for receiving a second request from the remote client system via the first network; and  
circuitry operable for generating an HTML page using a set of selected data for a tool object corresponding to a managed tool for sending to the remote client system in response to said second request.
42. (previously presented) The data processing system of claim 41 wherein said HTML page has a portion operable for user entry of one or more values for modifying a tool object attribute.
- 43-44. (canceled)
45. (currently amended) The data processing system of claim 15 wherein said first request is ~~received transferred~~ in accordance with the hypertext transfer protocol (HTTP), ~~and said portion corresponds to a uniform resource locator (URL).~~
46. (canceled).
47. (previously presented) The method of claim 1 wherein said first network and said second network utilize the same local area network.
48. (previously presented) The data processing system of claim 15 wherein said network and said second network utilize the same local area network.
